

Cover Letter: Cache Wallet Software Engineer

To: Hiring Team, Cache Wallet

From: Onatola Timilehin Faruq

Re: Software Engineer (Remote)

I'm applying for the Software Engineer role at Cache Wallet. Your mission, solving the \$450 billion lost asset problem through a decentralized non-custodial smart wallet, maps directly to what I've been building for the past two years: wallet infrastructure, secure asset transfer protocols, and the backend systems that power them.

I won a hackathon building exactly this:

In February 2026, I won the Solana Privacy Hackathon with Privacy Chronicles: Glass Wallet, an interactive comic series teaching wallet users about MEV protection, surveillance resistance, and stealth addresses. I also won the Content Creation Track at the Zyperpunk Hackathon (Mina Foundation) with a 70+ page series on zero-knowledge proofs. Both wins were judged on technical depth and real-world applicability of wallet privacy concepts, the same problem space Cache Wallet operates in.

Why I'm relevant to Cache Wallet specifically:

I built OmniShield Wallet, a multi-chain HD wallet implementing BIP-39/32/44 key derivation across 6 blockchains with a privacy scoring algorithm. I also built Nocturne, a private payments protocol on Solana using stealth addresses and zero-knowledge proofs for secure asset transfers, the same class of problems Cache Wallet solves with its decentralized will and automated asset transfer features.

Backend and system design:

At DeFiConnectCredit, I architect backend systems integrating Aave v3, Uniswap v3, Curve, and GMX in production with 99.9% uptime. I've built REST APIs handling 10K+ daily requests, WebSocket servers supporting 1K+ concurrent connections, and distributed job queues processing 500+ operations per hour. My OmniSwap SDK demonstrates the OOP patterns and system design principles your role requires: chain-agnostic adapter architecture, typed error hierarchies, circuit breakers, and 70KB+ documentation.

Security-first development:

Every project I ship goes through rigorous testing. I established Foundry testing frameworks with 95%+ coverage at DeFiConnectCredit, catching 3 critical vulnerabilities before deployment. I built Sentinel, an automated smart contract auditing tool that detects reentrancy, oracle manipulation, and access control issues. For a wallet holding user assets, this security mindset is non-negotiable, and it's how I already work.

What I'd bring to Cache Wallet:

Production experience building exactly the type of systems you're developing: wallet key management, secure asset transfers, smart contract automation, and scalable backend infrastructure. I work independently, I ship documented code with comprehensive tests, and I stay current with the blockchain ecosystem because I'm actively building in it every day.

I'd welcome the chance to discuss how my experience aligns with what you're building.
