Dear CoW DAO Hiring Team,

I'm applying for the Smart Contract Engineer role. I build DeFi protocol integrations in Solidity and Foundry, and I've done it across the exact protocols your system routes trades through.

At DeFiConnectCredit, I integrate Aave v3, Uniswap v3/v4, Curve, and GMX in production. I've written the Foundry test suites (95%+ coverage), conducted security reviews on 15+ contracts catching oracle manipulation and reentrancy vulnerabilities pre-deployment, and reduced gas costs by 35% through assembly optimization. This is the kind of protocol-level Solidity work this role requires, and I've done it across the lending markets and DEXes that CoW Protocol interacts with daily.

I built Sentinel (github.com/Leihyn/sentinel), a multi-agent smart contract auditing framework. It runs Slither and Mythril for static analysis, uses specialized hunters for oracle manipulation, flash loan attacks, reentrancy (classic, cross-function, cross-contract, read-only), and access control, then generates Foundry-based PoC exploits validated against mainnet forks. The "investigating suspicious transactions and detecting on-chain misbehavior" part of this role is something I've built tooling for. Sentinel is written in Python, which covers the data and analysis side of the stack.

My Sentiment project (github.com/Leihyn/Sentiment), a Uniswap v4 dynamic fee hook, implements counter-cyclical fees based on real-time market data from 8 off-chain sources via Chainlink Automation and Gelato. Designing a hook that responds to market conditions and integrates cleanly with off-chain infrastructure is architecturally similar to what CoW Protocol does with its solver network and on-chain settlement.

I work publicly on GitHub with 12+ open-source repositories, detailed documentation, and CI/CD pipelines. I communicate primarily through writing, which fits the async-first, code-review-driven workflow you describe. I also have intermediate Rust from building Nocturne, a privacy protocol on Solana using Noir ZK proofs, and I'm actively deepening that through the School of Solana program.

My experience is under the seniority level you're targeting. What I'd point to is the breadth of DeFi protocol integration work, the security tooling I've built, and the fact that I architect solutions rather than patch them. Sentinel, OmniSwap SDK, and Sentiment are all ground-up designs, not forks.
